Workflow

? Synchronizing your fork with the main • RAT repository

What to do:

```
1 $ git remote add upstream git://github.com/cenpa/rat.git
2 $ git fetch upstream
3 $ git checkout master
4 $ git merge upstream master
```

What it does:

- 1 Add main RAT as another “remote” repository called “upstream”
- 2 Download differences between your repository and the main one
- 3 Check out changes from local repository to current working copy
- 4 Merge in the changes you just checked out. You may need to resolve conflicts at this point if your changes are incompatible with recent changes to the main repository

As always, this is applied to the local repository.
Changes will appear on github when you “git push” them.
