github
Workflow

? Synchronizing your fork with the main RAT repository

Note: If you are not using a fork, or just want to synchronize your local repository with your fork, just use "git pull."

Situation: While you are developing a feature on your fork, code that you want has been committed to the main RAT repository (or someone else's fork). You wish to bring your repository up to date with those changes.

1 Browse to your fork on github (http://github.com/username/rat)

2 Click on "Fork Queue" to see all commits that are in other forks but not yours.

3 Select the commits you would like to pull into your fork. To bring up to date with the main RAT repo, just "Select All" the commits under cenpa/rat.

4 Under the "Actions" drop-down, choose "Apply"

To see these changes in your local copy, you will need to pull them from github:

```
$ cd rat
$ git pull
```
